DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 3/5/07 has been entered.

Drawings

Replacements drawings 16-25 were received on 3/22/07. These drawings are accepted by the examiner.

Allowable Subject Matter

Claims 1-20 are allowed.

Claims 1-20 are allowable over the prior art of record for at least the reason that even though the prior art discloses 3D display systems where a spatial light modulator having a sequence of holographic patterns is illuminated by a sequence of color light beams, with the resulting beams being displayed at a projection screen, or 3D display systems where a spatial light modulator having a holographic pattern is illuminated by appropriate reconstruction light,

Art Unit: 2872

with the resulting diffracted light beams being spatially filtered by a mask having an aperture, the prior art fails to teach or reasonably suggest, regarding claims 1-10, a 3D image display apparatus for making illumination light components of multiple wavelengths incident to a hologram, wherein the illumination optical system sets the incident directions of the respective illumination light components of the wavelengths to the spatial light modulator so that diffracted waves of any order of the respective reproduced light components of the wavelengths are superimposed on each other in the aperture of the mask after the wavefront transformation by the reproduced image transforming optical system, and regarding claims 11-20, a 3D image display method of making illumination light components of multiple wavelengths incident to a hologram comprising the step of letting the illumination optical system set the incident directions of the respective illumination light components of the wavelengths to the spatial light modulator so that diffracted waves of any order of the respective reproduced light components of the wavelengths are superimposed on each other in the aperture of the mask after the wavefront transformation by the reproduced image transforming optical system, as set forth by the claimed combination.
